

Sprint Burndown

Nov 17, 2025 - Dec, 01 2025

The sprint burndown shows that although the team started with some early progress, work quickly plateaued and never approached the expected downward pace. The actual remaining work fluctuated throughout the sprint and even increased several times, indicating mid-sprint scope changes or re-estimations. Most work remained incomplete, and a significant spike on the final day returning the total to the full 100 points suggests that additional scope was added late, work was moved back out of “Done,” or large items were not truly finished. Overall, the team fell steadily behind the ideal trajectory due to limited completion of stories, likely caused by large or unclear work items, blockers, or overcommitment. The trend suggests the need for better story breakdown, tighter control of scope during the sprint, stronger handling of blockers, and more realistic sprint planning.
